

Stack in-class Test

Functional Programming

11.15, Thursday 12th March

1. Create a new Stack Project (call it your-name-anagram)
2. Build, install and run the default project, then change to implement the following :
 - a. Read in two strings
 - b. Print out the first string in uppercase
 - c. Print out "these strings are anagrams of each other"
3. You should use a Folder StringUtilities with two module(files) one is GenUtils and the other is Anagram in the library
4. The **GenUtils** module should contain (at least) the following function:
 - a. strToUpper which takes a string and returns the uppercase version of the string (using the toUpper function from Data.Char)
5. The **Anagram** module should contain the following function: isAnagram which takes in two strings and returns true if the two strings are anagrams of each other. (**an anagram a word, phrase, or name formed by rearranging the letters of another, such as spar formed from rasp**),

(Hint: If you sort two strings that are anagrams of each other, the sorted strings will be equal. You need Data.List to use the **sort** function).

Save this project, zip it and upload it to Moodle.
